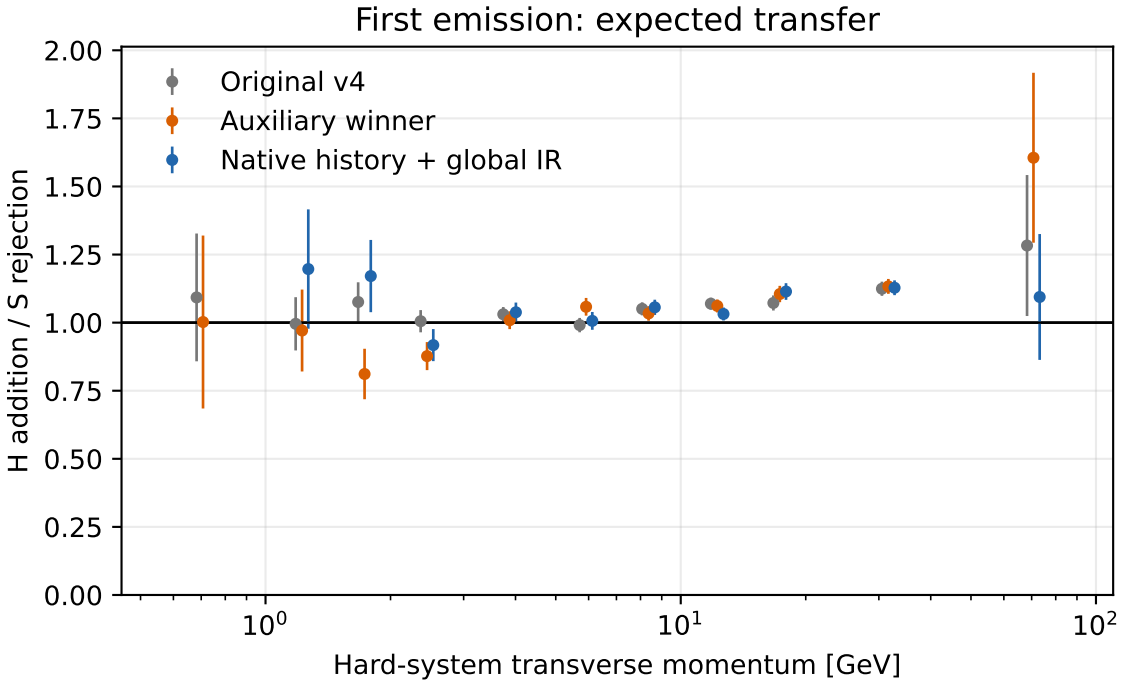
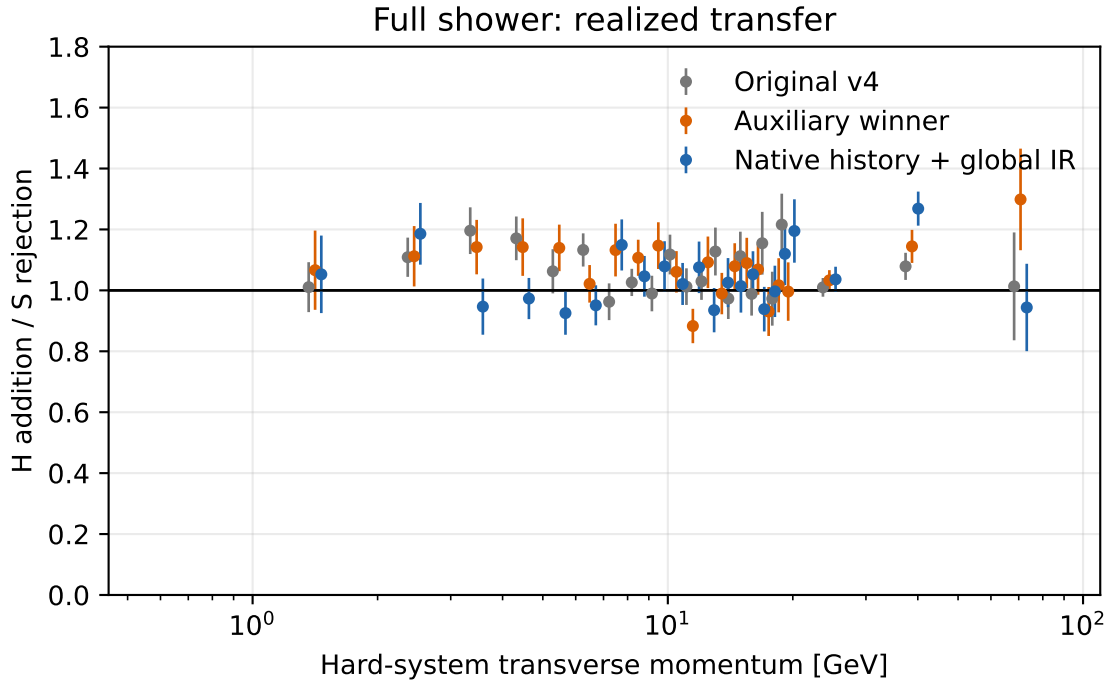
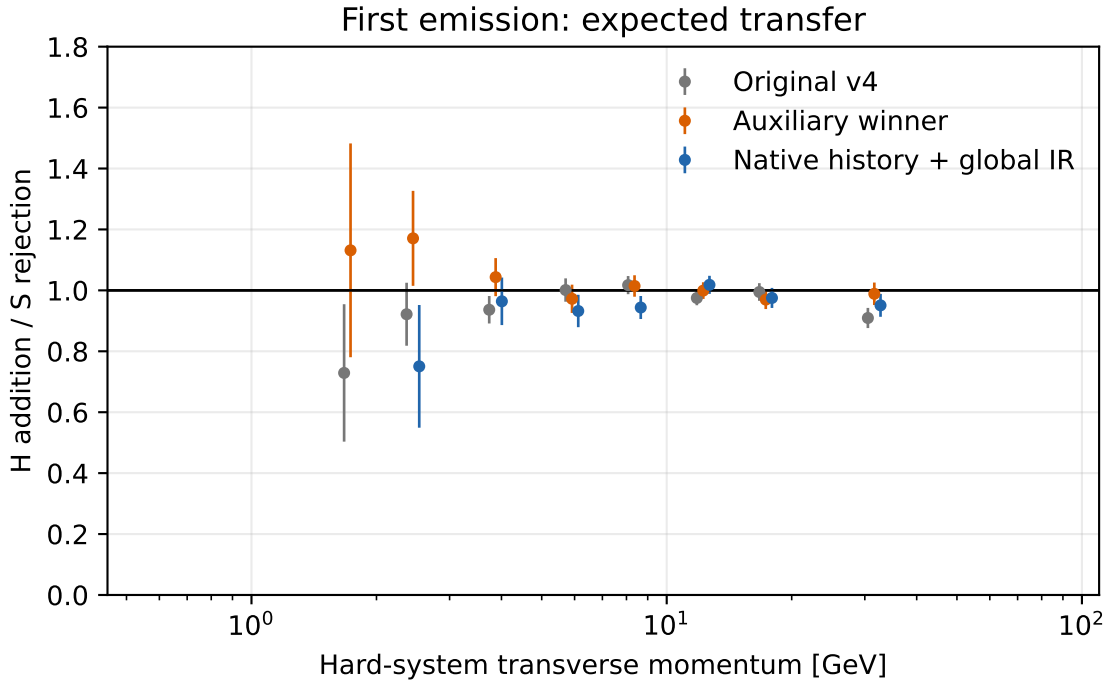
DY: independent 1M-event samples, 13 TeV, NNPDF4.0 NLO

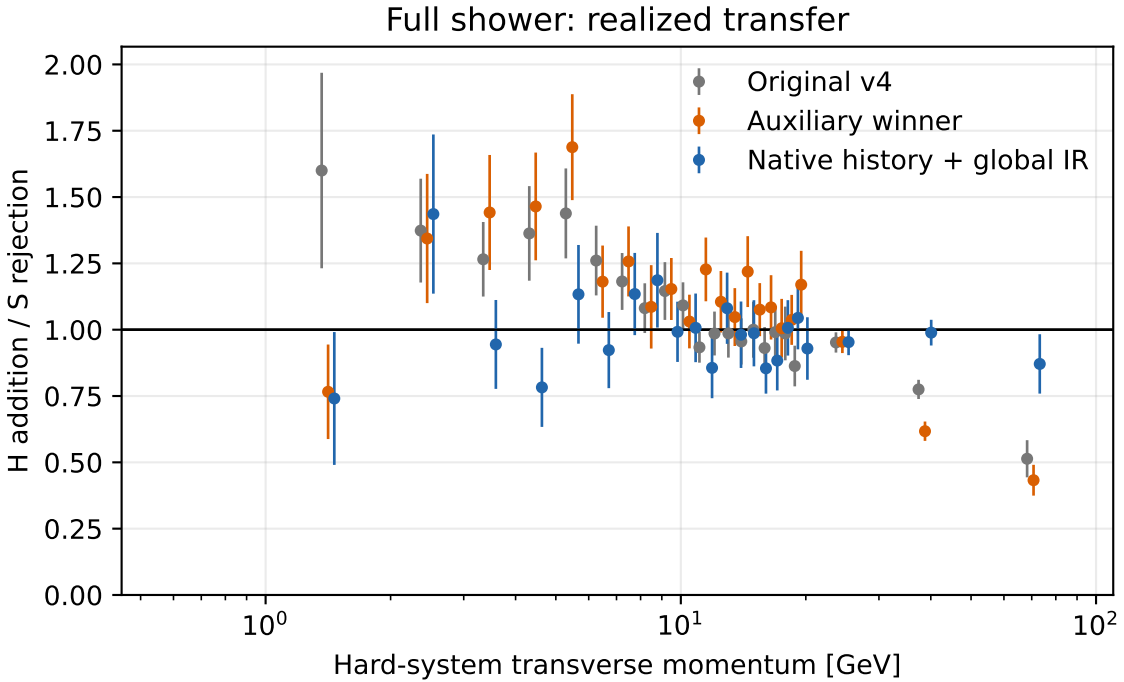




Finite-event errors before rejection; correlated 50-job errors after shower. Ratio bins shown only when both transfers are sampled and error <0.6.

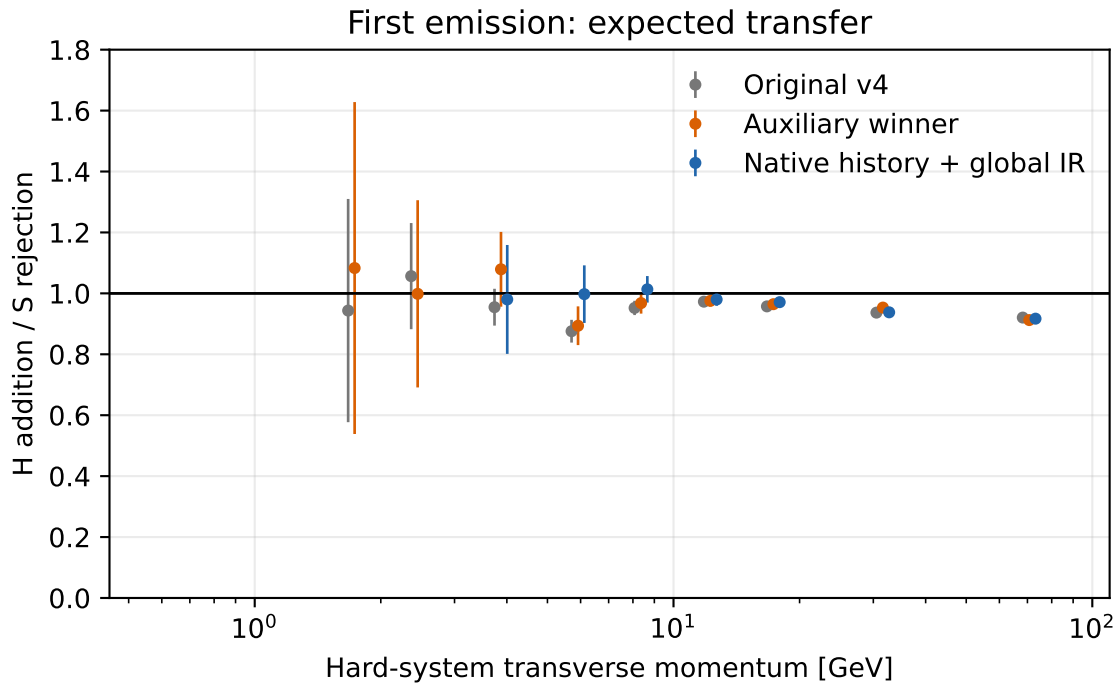
H: independent 1M-event samples, 13 TeV, NNPDF4.0 NLO

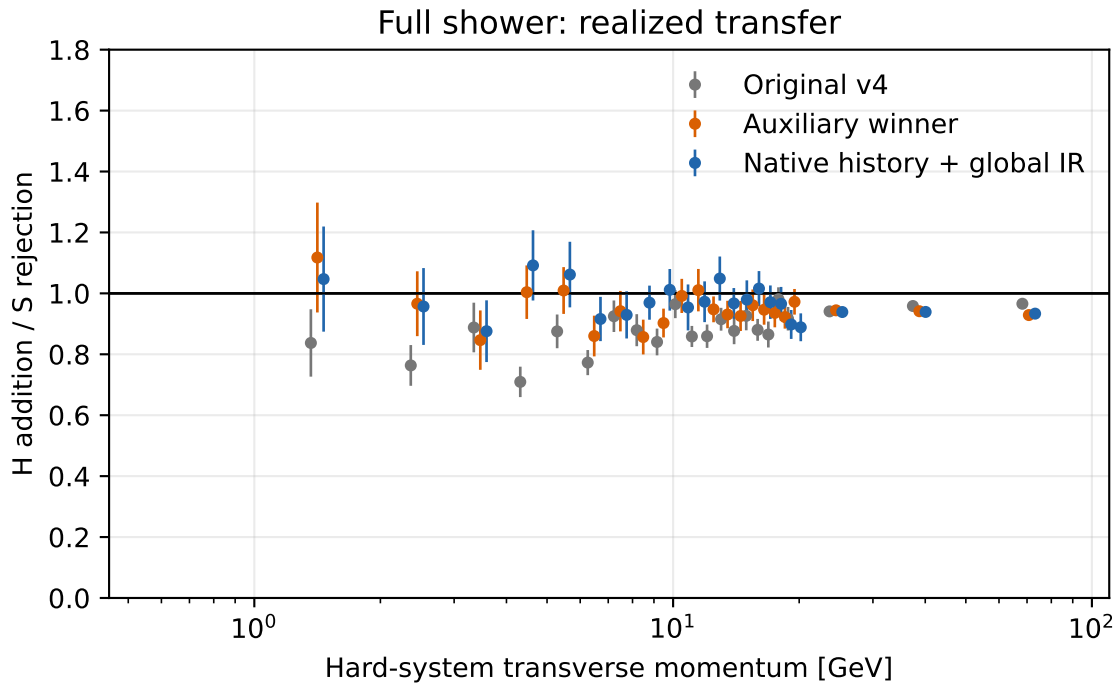




Finite-event errors before rejection; correlated 50-job errors after shower. Ratio bins shown only when both transfers are sampled and error <0.6.

ttbar: independent 1M-event samples, 13 TeV, NNPDF4.0 NLO





Finite-event errors before rejection; correlated 50-job errors after shower. Ratio bins shown only when both transfers are sampled and error <0.6. Original v4 had QEDByOther on; winner and native have all QED off.
