No-cut W+bbbar in 4FS: density-factor controls
Local-beta correction improves closure; radiator residuals remain
Recorded matcher
+ Born-scale density factor
+ held-out local beta (12×12)

Expected H-removal minus signed S-veto [pb]
Frozen first-emission probabilities; 1M source events. Local beta trained on independent 200k Born control with held-out S folds.
Displayed errors condition on fitted factors; normalization-agent results include their fit/control uncertainty. No end-to-end matching rerun.
