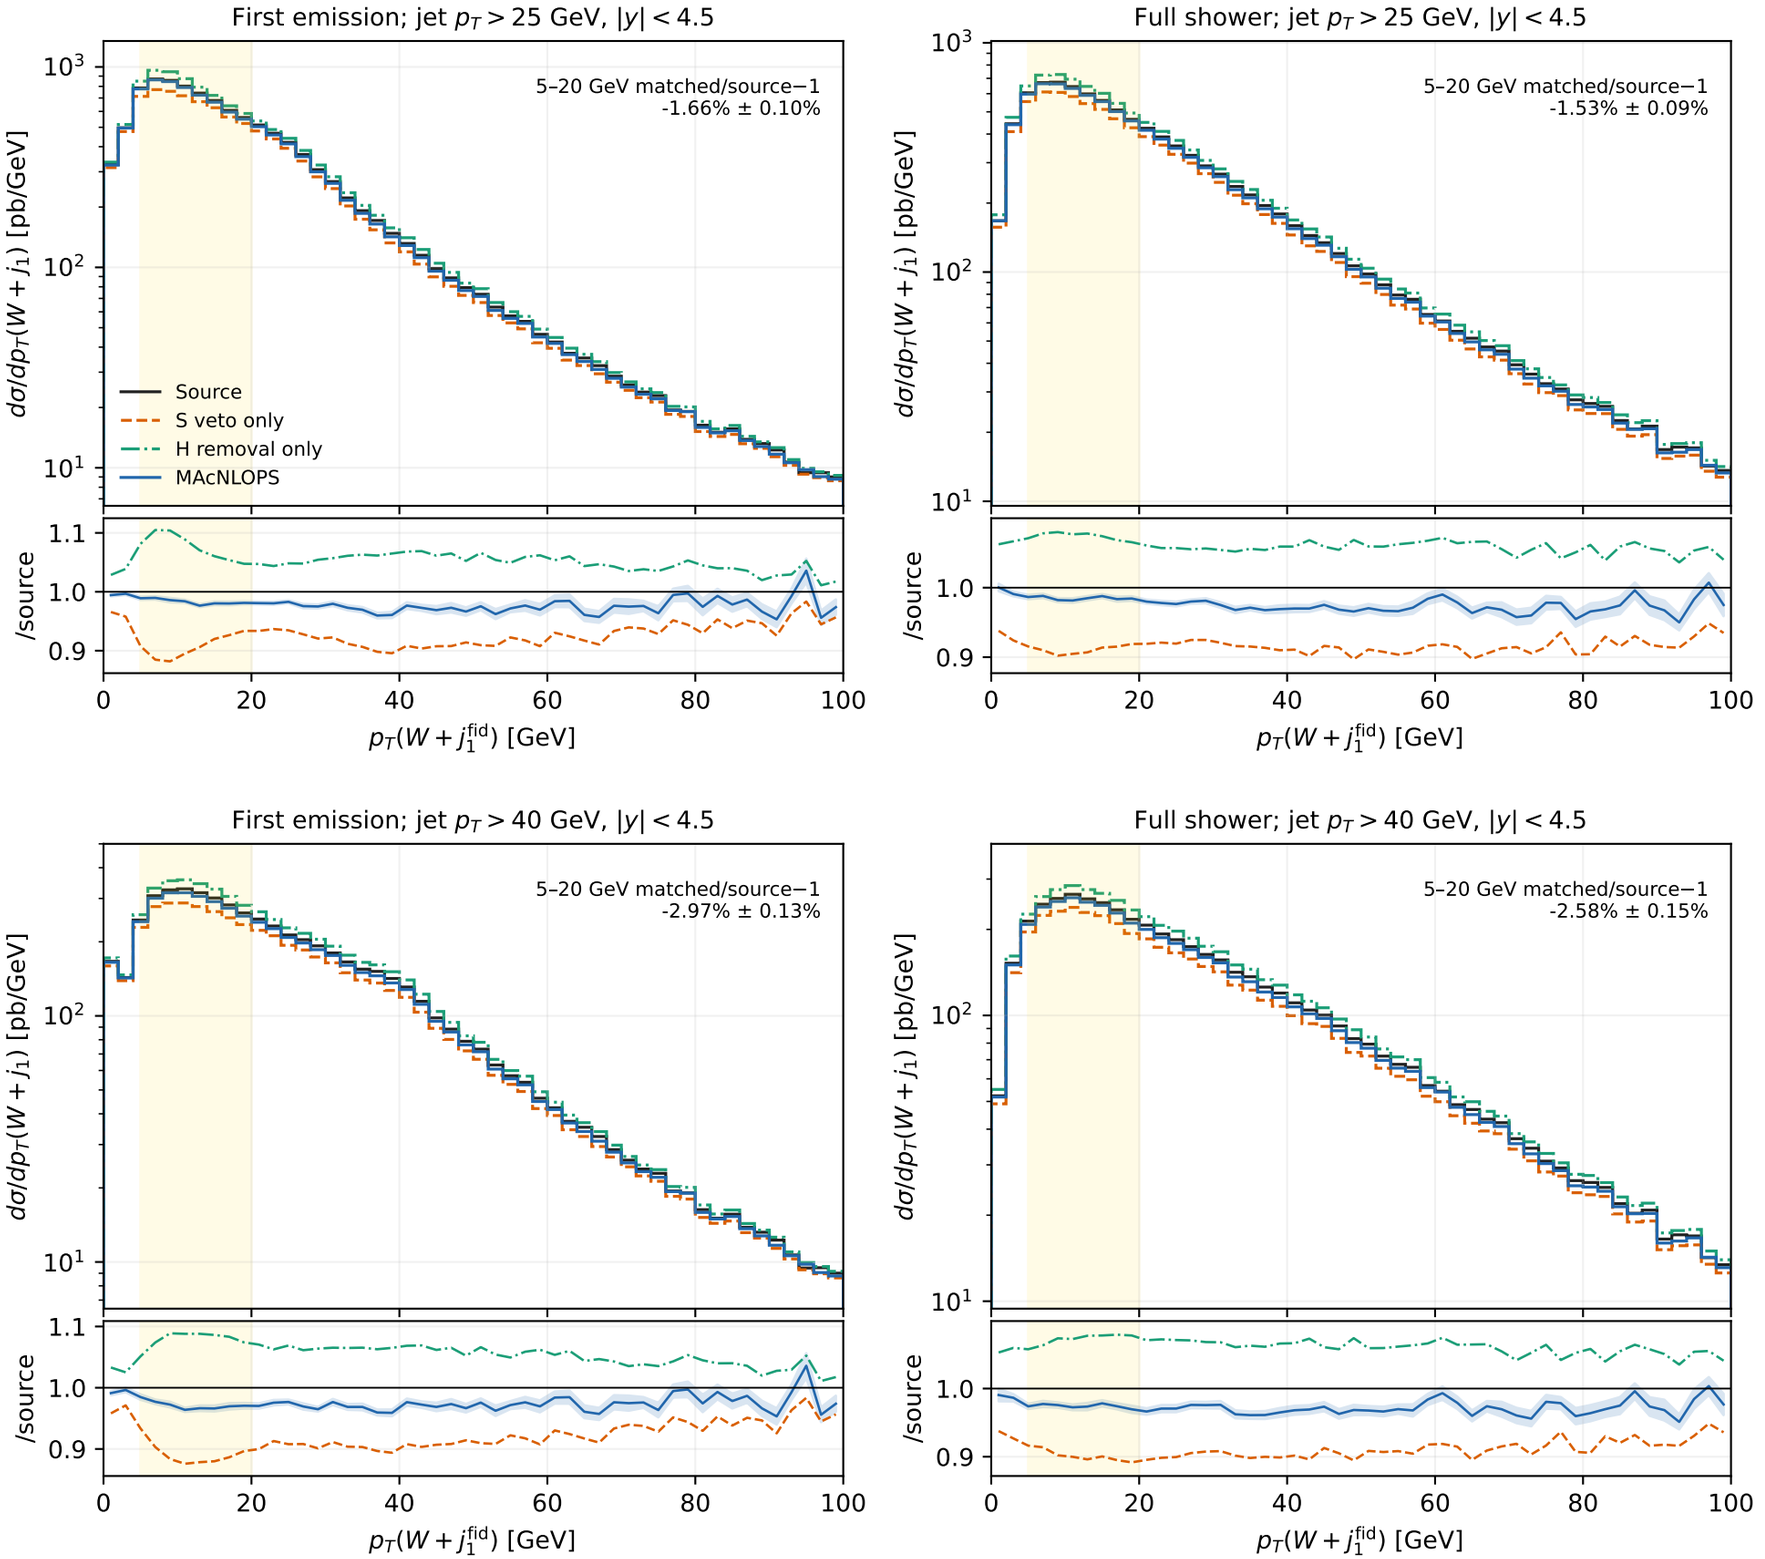
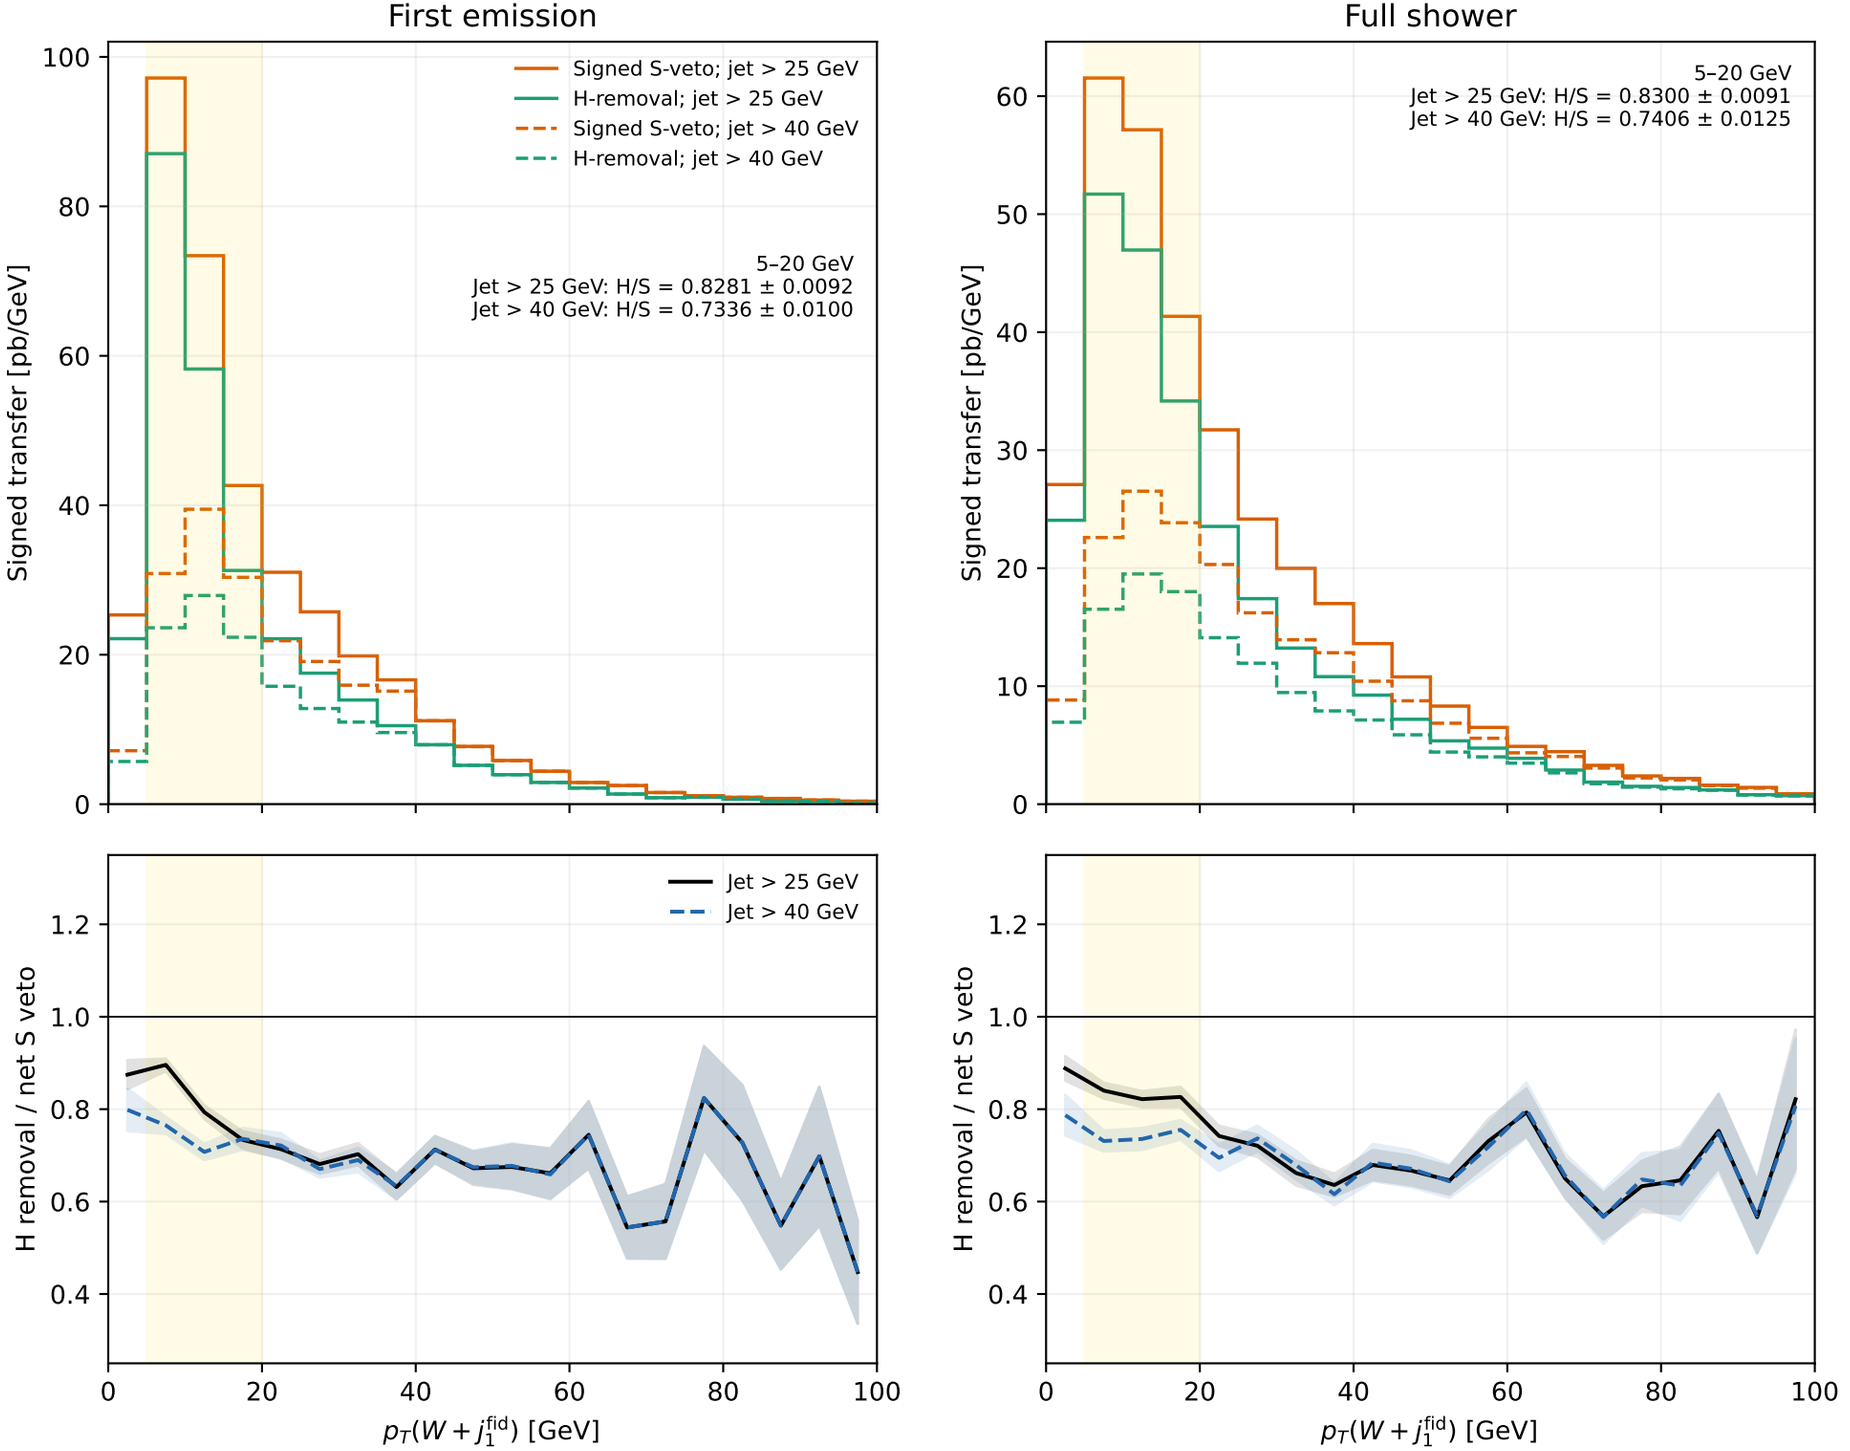
W+jet: analysis jet threshold 25 → 40 GeV, anti-kT R=0.5
Original pre-gluon-fix production epoch; generation jet cut 20 GeV



Same 1M original production events; matching weights, source and shower settings unchanged. Cuts applied separately at each stage. No fiducial/range renormalization.
Bands: conditional 50-chunk sampling errors. Hard integration, channel beta and native ISR-envelope uncertainties excluded.

W+jet: signed transfer balance under the 25/40 GeV analysis cuts
The highlighted 5–20 GeV interval is recoil, not jet transverse momentum



Same 1M original production events; matching weights, source and shower settings unchanged. Cuts applied separately at each stage. No fiducial/range renormalization.
Bands: conditional 50-chunk sampling errors. Hard integration, channel beta and native ISR-envelope uncertainties excluded.
